hard disk which will index all the prime numbers found with XSPRIME 2008 and print them out in sequential order. Two main implementations of the XSPRIME 2008 algorithm are included. One is based on a simple recursive algorithm that finds primes quickly, but can take a long time for large number searches. The other uses the GIMPS (Google Incorporated Millennium Prize Solving Project) algorithm which is a generalized version of the Sieve of Eratosthenes. XSPRIME 2008 takes advantage of the new Pentium 4 and Pentium 5 CPUs which have architectural features that allow the use of SIMD (Single Instruction, Multiple Data) instructions to greatly speed up the XSPRIME 2008 algorithm. XSPRIME 2008 can work with files up to 2 GB in size and can be run using simple text files, or with a more sophisticated binary, XML-based format. - Search for primes up to n. - Fast random number generation. - Relatively small code size. - High calculation speed. - As easy to use as an online search engine. - Can run on a PC, a tablet or an Android device. FAST PRIME FINDER is a CPU-based primes and prime factors search engine.
